PROJECT

Automatic Classification for Customer Transaction History

Nov. 2019 - Mar. 2020

funded by commercial bank in South Korea

Developed a classifier for customer's financial transactions such as payment, deposit, and credit card history. To handle the text data, we design a neural network with fastText and BERT.

Vision-based Quality Inspection

Mar. 2019 - Oct. 2019

funded by tire company in South Korea

Developed an anomaly classifier and anomaly region detector for various types of tire dataset. For efficient region detection, we developed a patch-based sampling and classification.

Multi-language, multi-source, Polymorphic data analysis

July 2016 - Dec. 2017

funded by National Research Foundation (NRF)

Developed a part-of-speech (POS) tagger with bidirectional LSTM and conditional random field (CRF). Developed a algorithm for relation extraction (RE), and entity resolution (ER) task for text dataset.

Estimation and Prediction of High-Speed Vehicle Trajectory

Mar. 2015 - June 2016

funded by Agency for Defense Development (ADD)

Developed a trajectory estimation and prediction model with interacting multiple model (IMM), Kalman filter and Gaussian processes model.
